

Did you know that effective waste management can help save the planet?

Waste management is a core infrastructure need for society, like power, transportation, and clean water.

Unmanaged or poorly managed waste can pollute the air, land, and water, and even contribute to climate change.

It is impossible to completely eliminate waste, so instead, the goal is to minimize the effect waste has on people's lives and the planet.

Twin Oaks Landfill is going above and beyond by creating renewable natural gas.

In collaboration with Morrow Energy, the Twin Oaks Renewables facility captures methane gas from the landfill and upgrades it to high-quality, clean, renewable gas for pipelines.

Beyond producing an essential energy source, this process benefits the environment by mitigating landfill gas emissions, enhancing local air quality, reducing odors, and, most importantly, positively impacting the Brazos Valley community.
